Why this trial might benefit your child...

- Short duration of study: 12 weeks
- Non-disruptive in home routine: very limited travel since designed as home based study
- Convenient oral liquid dosing of treatment: fruit taste
- Broad age range

Clinical trials are essential for accelerating the development of treatments to improve the lives of those living with Rett syndrome.

In pre-clinical trials, ANAVEX™ 2-73 has been shown to reduce many of the symptoms that affect Rett syndrome patients.

About the ANAVEX™ 2-73 trial

Anavex Life Sciences Corp. is looking for volunteers to participate in a clinical research study to examine the effects of the experimental drug ANAVEX™ 2-73, which has been already tested in human safety trials. In this clinical research study, volunteers will randomly receive either the study drug or placebo.

This design will enable us to assess the effectiveness of the study drug in Rett syndrome. For more detailed information please visit www.rettsyndrometrial.com, and complete the pre-qualifying survey.
